

PROJECT — KOST RENTAL DATA ANALYSIS

PROJECT OVERVIEW

This project analyzes kost rental listings using Microsoft Excel to explore rental price patterns and the distribution of listings across different regions and kost types.

Dataset

- 2,486 kost listings
- 17 columns

Tools

- Microsoft Excel
- PivotTable
- Excel Charts

STEP 1: DATA CLEANING AND PREPARATION

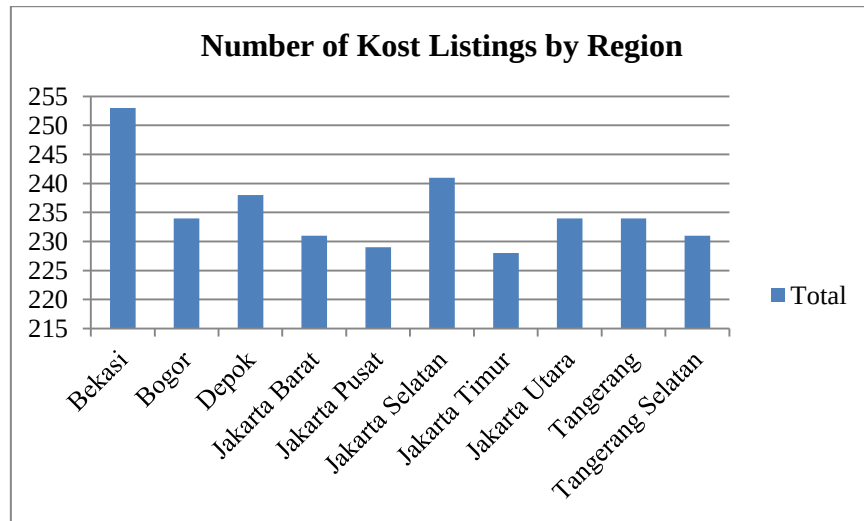

- The dataset was reviewed and cleaned using Microsoft Excel.
- Missing values and duplicate records were checked.
- Data types were reviewed to identify inconsistencies.
- Rental prices were converted from text format (e.g., Rp1.000.000) into numeric values using a price_clean column.
- N/A values in the price before discount column were excluded from numerical calculations.
- Original data was preserved while cleaned columns were created for analysis.

STEP 2: DESCRIPTIVE STATISTICS OVERVIEW

- Basic descriptive statistics were calculated using Microsoft Excel to understand the rental price distribution.
- The analysis included: Average rental price, Minimum rental price, Maximum rental price, and Total number of analyzed listings
- The rental price analysis was performed using the cleaned price_clean column.

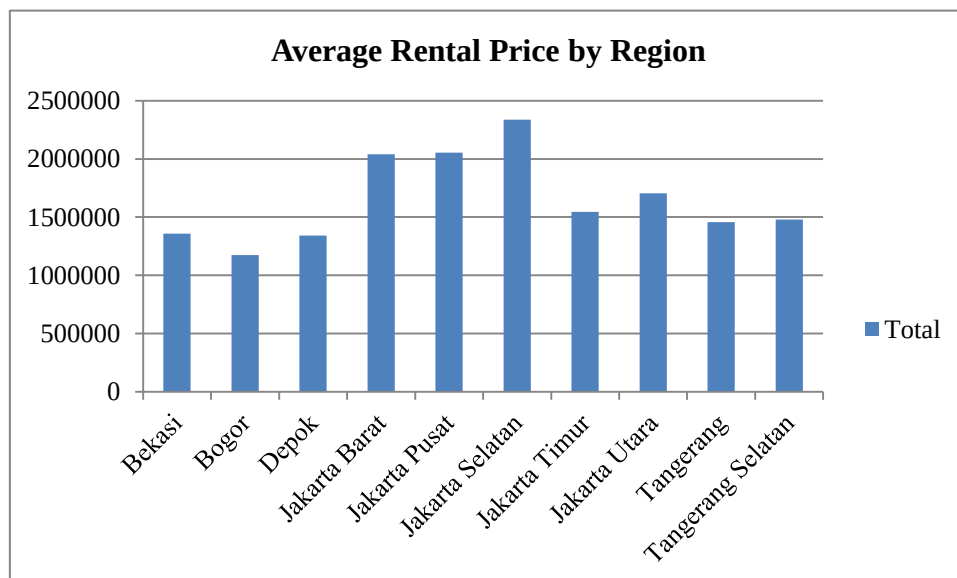

STEP 3: REGIONAL & KOST TYPE ANALYSIS

3.1 Number of Kost Listings by Region

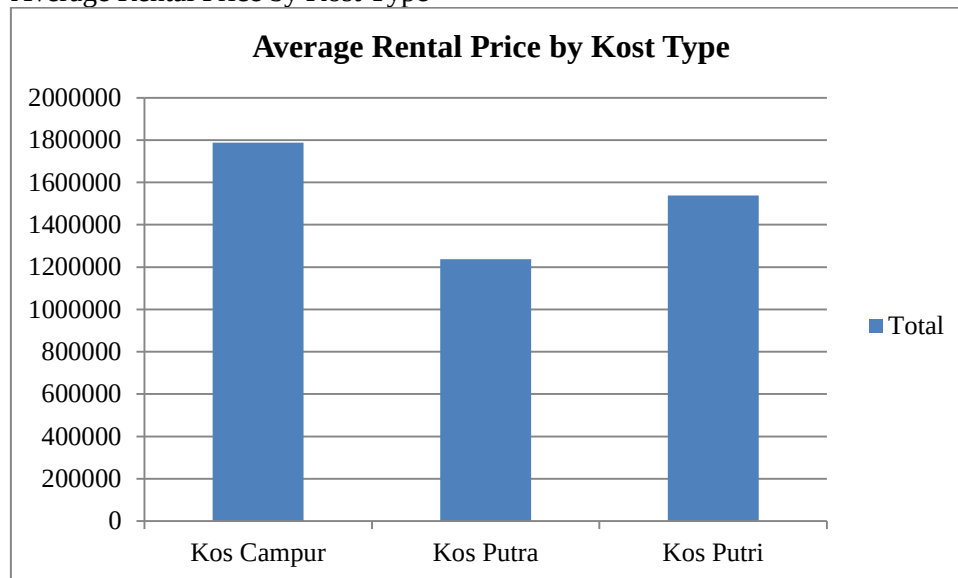

- A Pivot Table was created to determine the number of kost listings available in each region.
- The results were then visualized using a bar chart to facilitate comparison of the number of listings across regions.
- Based on the analysis, Bekasi has the highest number of kost listings, while East Jakarta has the lowest number of listings

3.2 Average Rental Price by Region

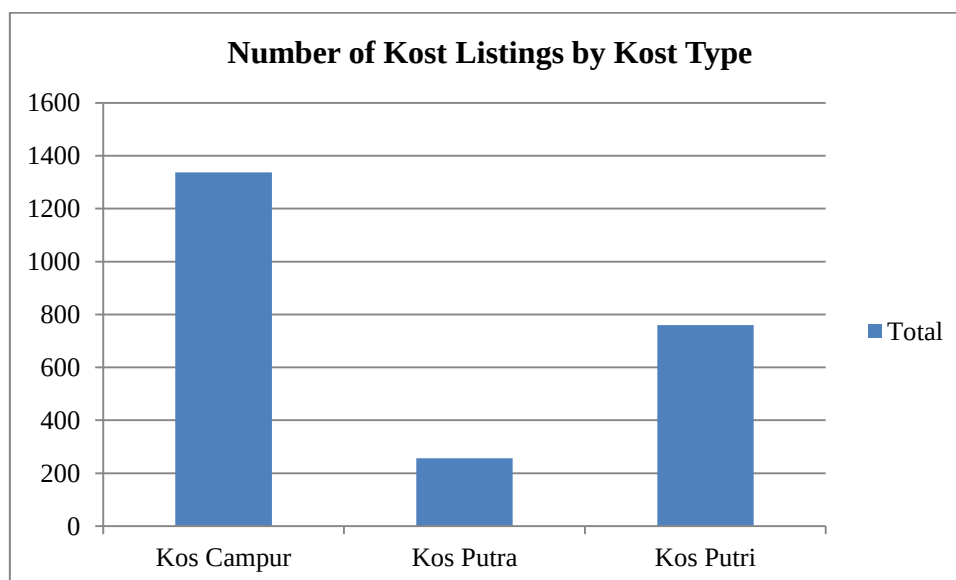

- The average rental price was calculated for each region using a Pivot Table.
- The analysis shows differences in the average rental prices across regions.
- Based on the analysis, South Jakarta has the highest average rental price, while Bogor has the lowest average rental price.

3.3 Average Rental Price by Kost Type

- A Pivot Table was used to compare the average rental prices based on each kost type.
- The analysis shows differences in the average rental prices among the different kost types.
- Based on the analysis, Mixed Kost has the highest average rental price, while Male Kost has the lowest average rental price.

3.4 Number of Kost Listings by Kost Type

- The number of kost listings was analyzed based on each kost type using a Pivot Table.
- The results were then visualized using a chart to facilitate comparison of the number of listings across each kost type.
- Based on the analysis, Mixed Kost has the highest number of listings, while Male Kost has the lowest number of listings.

STEP 4: OUTLIER ANALYSIS

- Analisis dilakukan dengan memeriksa beberapa harga kost dengan nilai terendah dan tertinggi.
- Harga kost dalam dataset berada pada rentang Rp450.000 hingga Rp4.500.000.
- Berdasarkan pemeriksaan awal terhadap nilai harga terendah dan tertinggi, tidak ditemukan nilai yang terlihat sangat jauh atau terisolasi dari nilai lainnya.
- Oleh karena itu, nilai minimum dan maksimum tetap dipertahankan dalam analisis.

STEP 5: KEY INSIGHTS

- Listing Distribution by Region
Bekasi has the highest number of kost listings, while East Jakarta has the lowest number of kost listings.
- Average Rental Price by Region
South Jakarta has the highest average rental price, while Bogor has the lowest average rental price.
- Analysis by Kost Type
Mixed Kost has the highest average rental price and the largest number of listings. Meanwhile, Female Kost has the lowest average rental price, while Male Kost has the lowest number of listings.
- Rental Price Variation
The rental prices in the dataset range from Rp450,000 to Rp4,500,000, indicating considerable variation in rental prices among the analyzed listings.
- Price Extremes
Based on the initial inspection of the lowest and highest rental prices, no values appeared to be extremely isolated from the other observations. Therefore, the minimum and maximum values were retained for the analysis.

CONCLUSION

This project analyzed kost rental listings using Microsoft Excel, covering data cleaning, descriptive statistics, regional analysis, kost type analysis, and rental price analysis. The results show differences in the number of listings and average rental prices across regions and kost types. Bekasi had the highest number of listings, while South Jakarta had the highest average rental price. The rental prices ranged from Rp450,000 to Rp4,500,000, indicating considerable variation in rental prices within the dataset. Overall, this analysis demonstrates how Microsoft Excel can be used to clean, analyze, visualize, and extract meaningful insights from rental listing data.
